Cocktail Mixer

Group project members:

Duncan   Jair   Behta   Jairo   Emily   Cooper   Ben

Project Description:

For adults 21 & over who want to have mixed drinks in the comfort of their own home our project is a cocktail website to help users try new drinks. With username and password, users can Input what they have at home then the website gives recommendations on what to make. Many people want to make drinks they usually have at bars but they may not know how to make their cocktails at home. This will aid them by providing them suggestions on how to make them.

It displays a variety of ingredients used to mix drinks with. The user clicks the ingredients they have in order to receive different drinks they can make from those ingredients. The user will receive a variety of drinks from those ingredients displayed in small cards which include the ingredients of those drinks and the measurements for those ingredients. Not only that but if the user doesn't have a clue what they want to make, there is an option to receive a random cocktail to make with the ingredients required for it.

Contributions:

Jairo:

The main portion of the project I contributed was the capability of storing new users' information so they can sign up for our website. I also came up with the idea of having the Xcel sheet to replace Jira as we were having some difficulties using Jira as a project tracker. I helped with converting the html files to ejs and tried to help others in the group

if they were stuck on something. Duncan and I figured out how to display the user's name after they login.

```

My contribution to the project was mainly with the login/sign-up page (I did the login portion, Jairo did the signup portion). My work initially started with styling the page to match the theme of our website, I then added a modal and modified it to fit the specifications of a login window. I then worked on the back end database side to use a post in order to verify the user trying to login was actually in our database. My final contribution was (with Jairo) to send the user information (name, id, ect.) to the rest of the website and display the first name on the navbar.

    Milestone4
```

For the most part, I worked on the ingredients page. I designed the html of the page and the cards that popped up dynamically through the EJS file. Within that page we need to pull information from our external API based on the ingredients selected by the user. I made the functions that link our selected ingredients to drinks in the API as well as the one that links a drink name to a list of ingredients and measurements. I also sent that data to the EJS file to be displayed to the user.Additionally, I made the nav bar for the website. The files I wrote in were primarily, server.js and ingredients.ejs.

Emily Dunbar
I worked on the home page html css and created the new revised Architecture Diagram. I also stylized the Favorites page and adding checkboxes to the ingredients page and worked on card.ejs. I wrote the code that would take the user's input (from the checkboxes) and assort their choices in an array so we could search our DB for the ingredients that were chosen. I wrote the POST call and a call to search the DB and render the results. (UI, APi calling and DB searching for ingredients page)

```

Jair:

 I created the SQL DDL that would create the tables when docker was run. I updated the YML file so that it created our database so that those tables could be added. I created the data shema we used. I helped find an API and test it using Postman. I made sure it did what we wanted it to do by testing out different calls. I helped contribute to creating the main code that helped pull from our rest API with a call that had ingredients in order to return a list of drinks. I created separate calls that incorporated another API call that returned one random drink.

Cooper:

I ended up creating the wireframe design and co-created the home page, architecture diagram, and the favorites page. In terms of the home page, I helped create the html/css file by creating

containers with descriptions of the website. I also implemented the photos on the home page and organized them to make it look pleasing to the eye. For the wireframe, I used Figma to create a prototype that was useful in the development of our actual website. The architecture diagram was created through Draw.io which had many templates that were useful in creating a simplistic and easy to understand diagram. The last thing I mainly worked on was the favorites page, which unfortunately was unable to complete, where I focused mainly on the GET/POST requests on the server.js file and other coding that went into the favorites page.

Behta:

I contributed by creating the favorites page, the star icon, and assisting with the faviortes bookmoark/button. I wrote code for the favorites page. I frist created a diagram of what it would look like and how it was going to work. I used Figma for that, it help with coming up with imagery and gave me somewhere to start and, other than that, I also used miro board as well. For the star icon, I simply was creating a like/favorites button for the favorites page. Which brings me to the favorite button, which unfortunately I wasn't able to get working at the final stages. I was working with the button to use the table to frist allow the user to interact with the frontend and then send what ever card they wanted back to the favorites table. I got it to send but I couldn't get it pop up on the favorites page.
